

LDO14802_300mA LOW POWER LDO

FEATURES

- Low Quiescent Current I_Q :
2.5uA Typical at Light Loads
- 300mA Nominal Output Current
- Low Dropout Voltage
- Low Temperature Coefficient
- High Input Voltage (up to 48V)
- Output Voltage Accuracy: $\pm 2\%$
- Fixed 3.0V, 3.3V, 3.6V and 5V
Output Voltage
- Over temperature Protection
- Short Circuit Protection
- Micro SIZE PACKAGES: SOT23-3,
SOT89-3L and SOT89-3L(L-Type)

APPLICATIONS

- Audio/Video Equipment
- Communication Equipment
- Battery-Powered Equipment
- Automotive Head Unit
- Laptop, Palmtops, Notebook
Computers

DESCRIPTION

The LDO14802 is a set of low power high voltage regulators implemented in CMOS technology. Which can provide 300mA output current. The device allows input voltage as high as 45V. It is very suitable for multicell battery systems, bus voltage power supply systems and other high DC voltage systems. Wide input voltage can make it well withstand the impact of surge voltage and ensure the stability of output voltage.

The LDO14802 only 2.5uA (typical) current is consumed by itself, which is especially important in multi-battery power supply systems and can reduce the standby power consumption of the whole system.

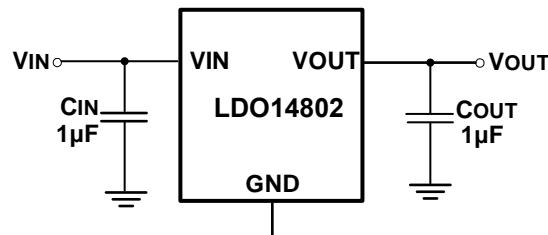

The LDO14802 is available in Green SOT23-3 and SOT89-3L packages. The over temperature is 150° C.

NOTES:

1. $V_{IN} = V_{OUT}$ (NOMINAL) or 2.5V, whichever is greater.
2. Maximum output current is affected by the PCB layout, size of metal trace, the thermal conduction path between metal layers, ambient temperature and the other environment factors of system. Attention should be paid to the dropout voltage when $V_{IN} < V_{OUT} + V_{DROP}$.
3. The dropout voltage is defined as $V_{IN} - V_{OUT}$, when V_{OUT} is 100mV below the value of V_{OUT} for $V_{IN} = V_{OUT}$ (NOMINAL) + 2V.
4. Output voltage temperature coefficient is defined as the worst-case voltage change divided by the total temperature range.

DETAILED DESCRIPTION

Overview

The LDO14802 low-dropout regulators (LDO) consumes only $2.5\mu A$ of quiescent current at light load and delivers excellent line and load transient performance. These characteristics, combined with low noise and good PSRR with low dropout voltage, make this device ideal for portable consumer applications.

Functional Block Diagram

Thermal Considerations

When the junction temperature is too high, the thermal protection circuitry sends a signal to the control logic that will shut down the IC. The IC will restart when the temperature has sufficiently cooled down. The maximum power dissipation is dependent on the thermal resistance of the case and the circuit board, the temperature difference between the die junction and the ambient air, and the rate of air flow. The GND pin must be connected to the ground plane for proper dissipation.

Applications Note:

- 1) The phase compensation circuit and ESR of the output capacitor are used inside the circuit to compensate, so a capacitor larger than $1.0\mu F$ must be connected to the ground.
- 2) It is recommended to use $1\mu F$ polar capacitors for input and output, and to keep the capacitors as close to the VIN and VOUT pins of LDO as possible.
- 3) Pay attention to the use conditions of input and output voltages and load currents to avoid the power consumption (PD) inside the IC exceeding the maximum power consumption allowed by the package.

$$PD = (VIN - VOUT) \times IOUT$$

$$T_{PN} = PD \times R_{0JA} + T$$

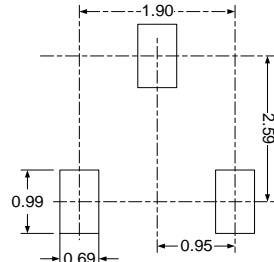

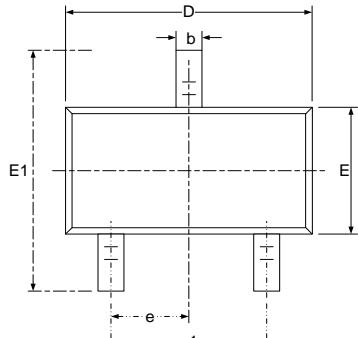

T_{PN} is junction temperature

T is ambient temperature.

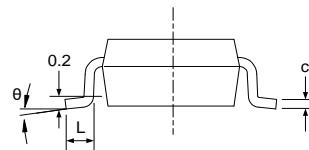

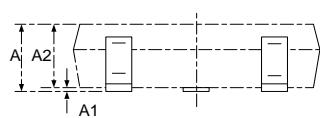

- 4) When the input voltage V_{IN} is greater than 2.5V, if V_{IN} is also higher than the output set value plus the device dropout voltage, V_{OUT} is equal to the set value. Otherwise, V_{OUT} is equal to V_{IN} minus the dropout voltage. If V_{IN} lower than 2.5V, the V_{OUT} is:

$$V_{OUT} = V_{IN} - V_{Dropout}$$
